

Adjoint Equation

Looking at an optimal control problem

$$\min_{y,u} J(y, u) \text{ subject to } E(y, u) = 0$$

Where

$$J(y, u) = \frac{1}{2} \int_0^T u^2 dt + \frac{1}{2} (y(T) - y^T)^2 \quad (1)$$

and

$$E(y, u) = y' - \alpha y - u \quad (2)$$

$$y(0) = y_0 \quad (3)$$

Differentiating J is required for solving the problem. To do this we reduce (1) to $\hat{J}(u) = J(y(u), u)$ and computing its gradient in direction s . Will use the notation: $\langle \hat{J}'(u), s \rangle$ for the gradient.

$$\langle \hat{J}'(u), s \rangle = \left\langle \frac{\partial J(y(u), u)}{\partial u}, s \right\rangle \quad (4)$$

$$= \left\langle \frac{\partial y(u)}{\partial u}^* J_y(y(u), u), s \right\rangle + \langle J_u(y(u), u), s \rangle \quad (5)$$

$$= \langle y'(u)^* J_y(u), s \rangle + \langle J_u(u), s \rangle \quad (6)$$

Here $\langle \cdot, \cdot \rangle$ is the L^2 inner product. The difficult term in (6) is $y'(u)^*$, so lets first differentiate $E(y(u), u) = 0$ with respect to u , and try to find an expression for $y'(u)^*$:

$$\frac{\partial}{\partial u} E(y(u), u) = 0 \Rightarrow E_y(y(u), u) y'(u) = -E_u(y(u), u) \quad (7)$$

$$\Rightarrow y'(u) = -E_y(y(u), u)^{-1} E_u(y(u), u) \quad (8)$$

$$\Rightarrow y'(u)^* = -E_u(y(u), u)^* E_y(y(u), u)^{-*} \quad (9)$$

This means that

$$y'(u)^* J_y(u) = -E_u(y(u), u)^* E_y(y(u), u)^{-*} J_y(u) = -E_u(y(u), u) \lambda \quad (10)$$

where λ is the solution of the adjoint equation

$$E_y(y(u), u)^* \lambda = J_y(u) \quad (11)$$

This again means that

$$\langle \hat{J}'(u), s \rangle = \langle -E_u(y(u), u) \lambda, s \rangle + \langle J_u(u), s \rangle \quad (12)$$

Before we derive the adjoint equation, let's find E_u , E_y and $\langle J_u(u), s \rangle$ with respect to (1), (2) and (3).

$$E_u(y(u), u) = -1 \quad (13)$$

$$E_y(y(u), u) = \frac{\partial}{\partial t} - \alpha + \delta_0, \text{ where } \delta_0 \text{ is evaluation at } 0 \quad (14)$$

$$\langle J_u(u), s \rangle = \int_0^T u(t)s(t)dt \quad (15)$$

The expression for E_u gives us:

$$\langle y'(u)^* J_y(u), s \rangle = \langle -E(y(u), u)^* \lambda, s \rangle = \int_0^T \lambda(t)s(t)dt \quad (16)$$

To derive the adjoint equation, we write the operator $E_y(y(u), u)$ applied to a function v on variational form, and try to find the adjoint of E_y :

$$\langle E_y v, w \rangle = \int_0^T (v'(t) - \alpha v(t) + \delta_0 v(t))w(t)dt \quad (17)$$

$$= \int_0^T v'(t)w(t)dt - \alpha \int_0^T v(t)w(t)dt + v(0)w(0) \quad (18)$$

$$= - \int_0^T v(t)w'(t)dt + v(t)w(t)|_0^T - \alpha \langle v, w \rangle + v(0)w(0) \quad (19)$$

$$= - \int_0^T v(t)w'(t)dt - \alpha \langle v, w \rangle + v(T)w(T) \quad (20)$$

$$= \langle v, Pw \rangle \quad (21)$$

Where $P = -\frac{\partial}{\partial t} - \alpha + \delta_T$. This means that $E_y^* = P$, and we now have the left hand side in the adjoint equation. The right hand side of the equation is $J_y(y(u), u)$. Let's look closer at this term:

$$J_y(y(u), u) = \frac{\partial}{\partial y} \left(\frac{1}{2} \int_0^T u^2 dt + \frac{1}{2} (y(T) - y^T)^2 \right) \quad (22)$$

$$= \frac{\partial}{\partial y} \frac{1}{2} (y(T) - y^T)^2 \quad (23)$$

$$= \frac{\partial}{\partial y} \frac{1}{2} \left(\int_0^T \delta_T (y - y^T) dt \right)^2 \quad (24)$$

$$= \delta_T \int_0^T \delta_T (y(t) - y^T) dt \quad (25)$$

$$= \delta_T (y(T) - y^T) = L \quad (26)$$

Our adjoint equation on variational form then becomes $\langle P\lambda, w \rangle = \langle L, w \rangle$, which we can write:

$$\langle -p' - \alpha p + \delta_T p, w \rangle = \langle \delta_T (y(T) - y^T), w \rangle \quad (27)$$

$$\langle -p' - \alpha p, w \rangle = \langle \delta_T (y(T) - y^T - p), w \rangle \quad (28)$$

This then gives us the ODE:

$$\begin{cases} -\lambda'(t) - \alpha\lambda(t) = 0 \\ \lambda(T) = y(T) - y^T \end{cases} \quad (29)$$

If we solve this equation and plug it into (12), we see that the gradient of J is

$$\langle \hat{J}'(u), s \rangle = \int_0^T (\lambda(t) + u(t))s(t)dt \quad (30)$$

Discretization

Let us discretize our interval $[0, T]$ using $N + 1$ points where

$$x_n = n\Delta t, \quad i = 0, \dots, N \quad \text{and} \quad (31)$$

$$\Delta t = \frac{T}{N} \quad (32)$$

We also let $y^n = y(x^n)$ and $u^n = u(x^n)$. The integrals in our functional and its gradient we evaluate using the trapezoidal rule, and we discretize our ODE $E(y, u)$ and the adjoint equation using the Backward Euler scheme. For $E(y, u)$ we get :

$$\frac{y^n - y^{n-1}}{\Delta t} = \alpha y^n + u^n \quad (33)$$

$$(1 - \alpha\Delta t)y^n = y^{n-1} + \Delta t u^n \quad (34)$$

$$y^n = \frac{y^{n-1} + \Delta t u^n}{1 - \alpha\Delta t} \quad (35)$$

Here the initial condition $y^0 = y_0$ is known. For the adjoint equation the initial condition is $\lambda^N = y^N - y^T$, and the Backward Euler scheme gives us:

$$-\frac{\lambda^n - \lambda^{n-1}}{\Delta t} - \alpha\lambda^n = 0 \quad (36)$$

$$\lambda^{n-1} - \lambda^n = \Delta t \alpha \lambda^n \quad (37)$$

$$\lambda^{n-1} = (1 + \Delta t \alpha) \lambda^n \quad (38)$$
