## Exercise 1

a) The  $H^p$  norm of a function  $u(x, y)$  of two variables on  $\Omega = (0, 1)^2$  is defined as follows:

$$\|u\|_{H^p(\Omega)}^2 = \sum_{i=0}^p \sum_{j=0}^i \binom{i}{j} \left\| \frac{\partial^i u}{\partial^j x \partial^{i-j} y} \right\|_{L^2(\Omega)}^2 \quad (1)$$

In our case  $u(x, y) = \sin(k\pi x) \cos(l\pi y)$ . We easily see that the derivative of this function can be expressed with the following formula:

$$\frac{\partial^i u(x, y)}{\partial^j x \partial^{i-j} y} = (k\pi)^j (l\pi)^i f_j(k\pi x) g_i(l\pi y) \quad (2)$$

where  $f_j$  is the  $j$ -th derivative of  $\sin(x)$  and  $g_i$  is the  $i$ -th derivative of  $\cos(y)$ . Now let's look at the  $L^2$  norm of (2).

$$\left\| \frac{\partial^i u(x, y)}{\partial^j x \partial^{i-j} y} \right\|_{L^2(\Omega)}^2 = (k\pi)^{2j} (l\pi)^{2i} \int \int_{\Omega} f_j(k\pi x)^2 g_i(l\pi y)^2 dx dy \quad (3)$$

$$= (k\pi)^{2j} (l\pi)^{2i} \int_0^1 f_j(k\pi x)^2 dx \int_0^1 g_i(l\pi y)^2 dy \quad (4)$$

Since  $f_j^2$  and  $g_i^2$  are:

$$f_j(x)^2 = \begin{cases} \sin^2(x) & j \text{ even} \\ \cos^2(x) & j \text{ odd} \end{cases}$$

and

$$g_i(y)^2 = \begin{cases} \cos^2(y) & i \text{ even} \\ \sin^2(y) & i \text{ odd} \end{cases}$$

and since

$$\int_0^1 \sin^2(l\pi y) dy = \int_0^1 \cos^2(l\pi y) dy = \frac{1}{2}$$

we get the following expression for the square of the  $L^2$  norm of a general derivative of  $u$ :

$$\left\| \frac{\partial^i u(x, y)}{\partial^j x \partial^{i-j} y} \right\|_{L^2(\Omega)}^2 = \frac{1}{4} (k\pi)^{2j} (l\pi)^{2i} \quad (5)$$

If we plug this into (1), we get

$$\|u\|_{H^p(\Omega)}^2 = \frac{1}{4} \sum_{i=0}^p \sum_{j=0}^i \binom{i}{j} (k\pi)^{2j} (l\pi)^{2(i-j)} \quad (6)$$

**Exercise 2**

a) Assume our solution is on the form  $u(x, y) = X(x)Y(y)$ . If we plug this into our equation and assume that both  $X$  and  $Y$  are nonzero, we get:

$$-\mu(X''Y + XY'') + X'Y = 0 \iff \frac{-\mu X'' + X'}{X} - \mu \frac{Y''}{Y} = 0 \quad (7)$$

$$\iff -\mu X'' + X' = \lambda X \text{ and } \mu Y'' = \lambda Y \quad (8)$$

For some  $\lambda$ . Together with the Neumann boundary conditions look at the equation for  $Y$ :

$$\begin{cases} \mu Y'' = \lambda Y \\ Y'(0) = Y'(1) = 0 \end{cases}$$

There are three possibilities:  $\lambda < 0$ ,  $\lambda > 0$  and  $\lambda = 0$ . Start with first:

Case (i)  $\lambda < 0$ :

$\lambda < 0$  implies that  $Y(y) = A \sin(ny) + B \cos(ny)$  where  $n = \sqrt{|\frac{\lambda}{\mu}|}$ , and  $A$  and  $B$  are constants.  $Y'(y) = n(A \cos(ny) - B \sin(ny))$  and  $Y'(0) = 0 \Rightarrow A = 0$ .  $Y'(1) = 0$  means that either  $B = 0$ , or  $n = k\pi$  for an integer  $k$ . Since we assumed  $Y \neq 0$ ,  $B = 0$  is not allowed, and  $Y(y) = B \cos(ny)$ .

Case (ii)  $\lambda > 0$ :

Now  $Y(y) = Ae^{ny} + Be^{-ny}$  where  $n = \sqrt{\frac{\lambda}{\mu}}$ , and  $A$  and  $B$  are constants.
